

**LIST OF QUESTIONS TO THE PANEL REGARDING ESTIMATION OF THE  
EXTENT AND TRENDS OF WEST COAST ROCK LOBSTER POACHING**

- 1) For the data available, how might the analysis methods being used be improved?
- 2) Have the results obtained from the current methods been accurately summarised?  
*Note that the current approach uses DAFF MCS data to provide poaching trend information, and TRAFFIC analyses to identify an absolute magnitude.*
- 3) The DAFF MCS confiscations and effort data, and the TRAFFIC analyses, suggest different trends in the extent of poaching over time; how best might these differences be taken into account?
- 4) How best might one determine reliably whether and to what extent the magnitude of poaching might change in the future?  
*Note that the basis for future management recommendations needs to incorporate the ability to react appropriately and timeously to adequate evidence for such possible changes.*
- 5) If additional compliance measures of a different nature are introduced, with possible impacts on the behaviour of poachers, how best might the existing poaching trend index derived from DAFF MCS data be calibrated?
- 6) Are there any suggestions for other possible approaches to quantify poaching magnitudes and trends, either with the data currently available, or with additional data which could be practically collected?
